

Brainstorming & Idea Prioritization

Brainstorming & Ideation · AI/ML and GenAI Track

Ideas considered for a Generative AI project in the health and wellness space:

#	Idea	Value to user	Feasibility	Decision
1	AI personalised 7-day workout planner	High	High – one LLM call, simple form	Selected (core)
2	Plan revision from user feedback	High	High – second LLM call on the stored plan	Selected
3	Daily nutrition / recovery tip	Medium	High – small, cheap prompt	Selected
4	Admin dashboard to view stored users	Medium	High – DB query + template	Selected
5	Photo-based food calorie estimator	Medium	Low – needs vision; accuracy risk	Future
6	Wearable / step-tracker integration	Medium	Low – device APIs, privacy	Future
7	Voice-based workout coach	Low	Low	Dropped

Prioritisation approach

Each idea was scored on user value against build effort. Ideas 1–4 give the most value for the least effort and together make a complete, demonstrable product, so they were chosen for version 1. Ideas 5 and 6 need extra data sources or hardware and are kept for the future plan. Idea 7 adds little beyond the text plan.

Selected concept

FitBuddy: a web app that takes a user's age, weight, goal and preferred intensity, and uses Google Gemini to produce a safe 7-day workout plan and a nutrition/recovery tip, which the user can refine with feedback.
